

# IRB Mortgage Component-level Survey 2024

Converging trends in Hybrid  
mortgage model suites

November 2024

# Executive summary

## Introduction

The industry is continuing to face challenges over Internal Ratings-Based (IRB) Hybrid model suites for residential mortgage portfolios. A majority of firms are still waiting on the final outcome of their regulatory submissions, with multiple rounds of feedback received, whilst continuing to hold sizeable temporary model adjustments (TMAs).

The Prudential Regulation Authority (PRA) is currently hosting a series of [roundtables](#) aimed at addressing industry-wide challenges and clarifying their expectations, where possible.

In light of these developments, as well as interest from firms for greater granularity in the key drivers of risk weight (RW) variability for mortgages, PwC has performed a component-level market survey, following on from our recent [Hybrid IRB risk-weight snapshot survey](#).

## Survey participants

A total of 12 firms have participated in this survey, covering Owner-Occupied (OO) and Buy-to-Let (BTL) lending, with all firms having received at least one round of formal feedback from the PRA on their IRB model submissions.

**Participants have a higher LTV distribution for their BTL portfolios in comparison to OO**

Figure 1. Bar chart shows LTV exposure distributions of participants.

## Key RW components uncovered in the survey

This survey aims to understand how continuing variability in RWs can be attributed to underlying components across Probability of Default (PD) and Loss Given Default (LGD) models, and identifying where firms are starting to converge in model outcomes. Key components captured in the survey include:

### Portfolio level

- Risk Weights, PD, LGD, Margins of Conservatism (MoC) and TMAs.

### Probability of Default

- End of term risk, central tendency, cyclical and rating system concentration.

### Loss Given Default

- Probability of Possession given Default (PPGD), Forced Sale Discount (FSD), Time to Sale (TTS) - outputs, model structures, segmentation and treatment of outliers.

# Benchmarking highlights

The survey has considered the underlying drivers of the new Hybrid mortgage model suites, with a summary of the trends outlined below. We will be happy to discuss more detailed results with you.

**15%**  
**25%**

Average RWs for  
OO and BTL

**4**

property limit to  
define portfolio  
landlords  
adopted by most

**1.2x**

Average central  
tendency is 1.2x  
higher for BTL  
portfolios

Over time, OO  
cyclicality has  
increased for  
participants,  
whereas BTL has  
slightly  
decreased

Hybrid PD is  
generally not  
sensitive to LTV,  
other than at the  
extremes

All firms use a  
consistent  
economic cycle  
for Through the  
Cycle (TtC)  
periods, but Point  
in Time (PiT)  
periods vary  
based on internal  
data availability

**25%+**

max risk grade  
concentration  
observed in spite  
of feedback

**50%**

of firms include  
outliers in LGD  
estimates (varies  
by component)

**67%**

of participants have separate in-default  
and not-in-default PPGD models

**15%**

Average PPGD is  
15% points  
higher for BTL

**10%**

Average FSD is  
10% points  
higher for BTL

**3 - 4yrs**

average TTS  
(driven by time  
from default to  
possession)

**30%**

Impact of MoCs  
on BTL is 30%  
higher than OO

# How we can help

## How we can help

We are supporting a number of current and aspirant IRB firms with their IRB model applications, leveraging our extensive experience to perform **targeted model reviews pre-regulatory submission**, as well as supporting **benchmarking of methodologies with market trends**. This includes, in **addition to the broader implementation support we provide**:

- Sharing **industry benchmarking insights on IRB RW and model outputs** and assessing the **appropriateness of conservatism** across model components.
- Providing **Board and senior management comfort** over the **plausibility** of the **submission** by assessing compliance against regulatory requirements.
- Gaining **further insights** into the **latest regulatory expectations** to **better prepare** for any **potential regulatory challenge**, especially on contentious matters that materially drive RWAs.
- Providing assurance through the **development of challenger models** using our toolkits.

## Our market-leading IRB benchmarking and technology

### IRB benchmarking

Our **market-leading benchmarking** provides in-depth insights into model components categorised by key risk drivers. This includes overall RW outputs by portfolio and LTV; PD and LGD parameters segmented by portfolio, LTV, and ID/NiD status; and LGD components detailing modeling approaches and parameter estimates.

### Innovative tech. solutions to support model development and compliance

- **Model Efficiency Manager (MEM)** toolkit, our low-code, cloud-based platform that offers extensive data profiling, challenger model development, model monitoring, and semi-automated model documentation features.
- **Reg Bridge**, PwC's cutting-edge AI tool used to support regulatory analysis and attestation by translating core regulation into data requirements, calculation logic, decision trees, interpretations and associated documentation in seconds.
